The printhead is an important component of a printer that sprays the ink onto the paper. So the printhead takes the instructions from the computer, as it evaluates the intensity, the location, the amount of ink needed to be dropped onto the paper and moves horizontally, point to point, to those locations to write or print the content. When the printhead fails or is identified as missing, your device may not be able to function like it always does. The problem is generally observed on HP Photosmart Plus, HP 8610, HP 8620, and HP 6700 Printers. Thankfully, there are simple fixes that can work around the problem. Therefore, the purpose of rebooting an HP printer is to reconfigure the printhead back to its correct position. Here is how you can reboot your HP printer: Turn on your HP printer and wait for it to remain idle and silent.Disconnect the power cord from the printer as well as your wall outlet. Wait for at least 1-2 minutes before you resume the operation.Now, connect all the cables with your printer as well as from the power source.Check your control panel's display to see if the 'HP printhead missing' error is popped up or not. Now pull the printhead without removing it from the carriage. Insert the printhead back to its carriage. Once you position the printhead, it will automatically snap into its place.Move the printhead left and right to see if the printhead is placed correctly into the cartridge.Lift the printhead's latch down to make sure that it is properly closed and locked. Also, close the exterior lid to resume the printing task.Now plug the power cord to the printer as well as to the power source. Turn on the printer now and wait for it to remain idle and silent.If you continue to face the HP printer printhead missing error, proceed to the next solution.
